

Collaborative Chartbook Governance

DCG-2026-05 | sharing, review and evidence scope

Purpose

This standard governs shared chartbooks used by the draw.io agent. Its identifier is DCG-2026-05. It distinguishes canvas edit rights, material visibility and approval rights; receiving one permission never implies the others.

Core rule

Every request is evaluated as the acting user. A shared chartbook may expose material only when an active share grants that user access. Cached evidence, an old citation or another editor's access does not expand the acting user's scope.

Unsupported data

The standard contains no real member email, invite token, tenant secret or production audit endpoint.

Roles and decisions

Native responsibility table

Role separation

Editors change the canvas, reviewers resolve evidence concerns and owners manage sharing. A single person may hold several roles, but every action is checked against the role required for that action.

Role	Edit canvas	Use shared material	Approve	Manage shares
Viewer	no	if granted	no	no
Editor	yes	if granted	no	no
Reviewer	comment	if granted	yes	no
Owner	yes	yes	yes	yes

Table result

A Reviewer may approve evidence changes but cannot manage shares. An Editor may edit the canvas but cannot approve a release.

Source-scope decision

Explicit, chartbook and automatic selection

Explicit source

A user-selected material limits the request even when other shared sources look more relevant.

Chartbook search

Without an explicit source, search begins with material attached to the active chartbook and visible to the acting user.

Broader search

Broader allowed material is considered only when automatic selection is enabled. The response records that scope expansion.

Removed access

Removing a share blocks new retrieval immediately. Existing canvases retain visible citation metadata but cannot hydrate protected content for an unauthorized viewer.

No-result state

A no-result response is valid only after every allowed search path completed. An unavailable index produces degraded state, not no answer.

Review and release route

Raster-only approval relationship

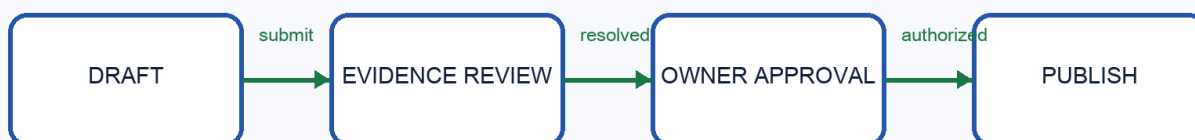

Figure scope

Figure 4 defines the ordered review route. The arrow after EVIDENCE REVIEW is present only in the raster diagram.

Blocking issue

An unresolved unauthorized-source finding blocks release regardless of layout quality. Review comments may be closed only by a reviewer or owner.

CHARTBOOK RELEASE ROUTE

Audit retention and revision

Dates, rejected draft and evidence package

Retention

Share changes, source selections and approval decisions are retained for 36 months. Canvas move events without factual changes are retained for 12 months.

Revision

Version 1.0 was approved on 18 December 2026 by the Collaboration Governance Board. A draft proposed 24-month share retention; that value was rejected.

Evidence package

Release evidence includes the acting-user scope, selected source versions, resolved findings and owner approval. A screenshot of the final canvas alone is incomplete.

Abstention

No invite token, private email, password or tenant key is included. Requests for those values are unsupported.

Exceptions and incident handling

Temporary access never bypasses authorization

Emergency review

An owner may appoint a temporary reviewer for up to 8 hours. The appointment grants review rights only and does not grant access to unrelated materials.

Incident

If unauthorized evidence appears, publishing is disabled, affected citations are quarantined and an audit record is opened. The canvas is not deleted automatically because unaffected user edits may remain valid.

Restoration

Release resumes only after scope is re-evaluated, unauthorized evidence is removed and a reviewer approves the corrected evidence package.
